

DO YOU HAVE TROUBLE IMPLEMENTING MONITORING POLICIES ON MOBILE USERS?

Most traditional filtering systems work as long as users are connected to their corporate network and information is passed through that network. However, in the case of mobile users they mostly don't connect to the corporate network and as such the organization has difficulty in applying policies on these devices.

e-Safe compliance solves this problem by doing all filtering at the client level and helps the organization to apply, and to police, policies on devices even when they are offline or are connected to a 3rd party network.

1 ENSURE NEW FORMS OF ACCESS SUCH AS 3G MODEMS OR TETHERING ARE USED FOR PRODUCTIVE PURPOSES AND NOT IN ORDER TO BYPASS THE CENTRAL FILTERING SYSTEM

As new forms of connectivity take hold corporates need to ensure they are being used for productive activity and not for bypassing central firewalls to access unproductive material.

e-Safe compliance does all its monitoring at the client level hence is not affected by how people can connect to the internet. Using e-Safe organizations can be assured that their policies will always be implemented on all devices whether off-line, connected to a 3rd party network or within the corporate framework.
